NAME

Net::Domain - Attempt to evaluate the current host's internet name and domain

SYNOPSIS

```
use Net::Domain qw(hostname hostfqdn hostdomain);
```

DESCRIPTION

Using various methods **attempt** to find the Fully Qualified Domain Name (FQDN) of the current host. From this determine the host-name and the host-domain.

Each of the functions will return *undef* if the FQDN cannot be determined.

hostfqdn ()

Identify and return the FQDN of the current host.

hostname ()

Returns the smallest part of the FQDN which can be used to identify the host.

hostdomain ()

Returns the remainder of the FQDN after the *hostname* has been removed.
